Introduction

This research is designed to answer the question “Is geographic location within the United States associated with disbelief in climate change?”. This project compliments past research that has attempted to identify particualr demographic characteristics that are associated with disbelief in climate change and investigates the role that one’s location may play in influcing personal beliefs regarding climate change. Previous research has found that white conservative men are more likley to deny the occurrence of climate chagne (McCright and Dunlap 2011) while other projects have found regional differences between perceptions of the risks posed by cliamte change (that sociologist from LSU 2009). This research adds to previous works by interrogating the regional attitudes of residents in the United States toward climate change and offers the first comprehensive comparison of geographic regions within the country.
